Essential Learning Concepts

Among the core subjects to be offered by the students at the G.C.E. (Ordinary Level) examination, the subject mathematics stands foremost. The main reason for this is that the success at the G.C.E. (O/L) examination depends on passing mathematics. The dream of following a subject stream, whatever it would be, at the G.C.E. (Advanced Level) comes true only by getting through the subject mathematics.

The students who have the ability as well as the fervour to study either Arts or Commerce at the G.C.E. (A. L.), will have to leave the school system because of their failure of Mathematics at the G.C.E.(O.L.) examination.

Inquiring further into this matter, the Ministry of Education appointed a special advisory committee for making recommendations to promote students' performance in Mathematics at the G.C.E. (O.L.) examination. Given below are some of the recommendations made by that committee through its report.

1. The content of Mathematics prescribed for secondary education.
 - (a) School Mathematics should not be tantamount to scholastic or research level mathematics.
 - (b) Mathematics at the secondary level in schools aims making the students knowledgeable citizens and help them develop some essential life skills.
 - (c) Mathematics is a supporting subject to learn the other subjects.
 - (d) To make learning more productive, there should be a sequence of priority in introducing mathematical concepts.
2. As remedy for the condition that everybody should learn the same mathematics at present, Essential Learning Concepts (ELC) have to be identified at Grades 10 and 11. This can be defined as a section that should compulsorily be learnt by one to be considered a person with numeracy (mathematical literacy) who can critically assess the social utility of mathematics.
3. It is also recommended to arrive at a consensus about Basic (Lowest) Achievement Level (BAL) which can be interpreted as the ability to display systematic and conceptual knowledge of solving problems belonging to Essential Learning Concepts.

4. As per the recommendations stated above with regard to the Essential Learning Concepts (ELCs), the composition of the mathematics question paper at the G.C.E. (O.L.) examination can be restructured as follows.
- The first paper of 2 hour duration will only include structured questions and short answer questions related to the ELCs defined in the syllabus. It encompasses the ability range of all the examination candidates and contributes 50% to the final result.
 - The second paper of 2 ½ hour duration will carry structured essay questions covering the entire syllabus. This is meant for the students with higher scholastic ability. This will be prepared targeting those who seek higher qualifications and aspire to enter higher academic streams. The contribution made by second paper to the final result is 50%.
 - Hence, if the pass mark of the Ordinary Level mathematics paper is considered 35%, any student scoring 70% (This is adjudged the basic achievement level of ELCs) for the first paper can have a pass in mathematics even without scoring any mark for the second paper.
 - Taking foregoing facts and also the document entitled ‘Essential Learning Concepts’ prepared by a team of experts led by Dr. Upali Mampitiya, the department of Mathematics of the National Institute of Education could identify the essential learning concepts a student is supposed to have when entering the Advanced Level Stream after grade 11. These after being subject to deliberation and discussion by a group comprising NCOE lecturers, in-service advisers and teachers were finalized. The subject content and learning outcomes related to the grade 10 and 11 ELCs so formulated are given below.

It is anticipated that question paper I introduced for the G.C.E. (Ordinary Level) examination in 2016 will test whether the student achieve this subject area.

Essential Learning Concepts

Content	Learning Outcomes	Notes
<ul style="list-style-type: none"> • Square root <ul style="list-style-type: none"> • Approximation (First approximation only) 	<ul style="list-style-type: none"> • Finds an approximate value for the square root of a whole number that lies between two consecutive perfect squares. • Finds the square root of a whole number which is not a perfect square, to the first approximation. • Recognizes that the square root of a whole number which is not a perfect square is a decimal number. 	<ul style="list-style-type: none"> • Whole numbers less than 100 which are not perfect squares only.
<ul style="list-style-type: none"> • Arithmetic Progressions <ul style="list-style-type: none"> • Introduction • n^{th} term 	<ul style="list-style-type: none"> • Identifies a number sequence in which the difference between two consecutive terms is a constant, as an arithmetic progression. • Identifies the technical terms relevant to arithmetic progressions. • Finds the n^{th} term of an arithmetic progression using the formula $T_n = a + (n - 1)d$ • Finds the value of n, when n^{th} term (T_n) of an arithmetic progression is given. 	<ul style="list-style-type: none"> • a and d are integers only.
<ul style="list-style-type: none"> • Solving problems involving fractions 	<ul style="list-style-type: none"> • Analyzes instances where fractions are used in day to day life. • Solves problems related to day to day life using fractions with BODMAS rule. 	<ul style="list-style-type: none"> • Expressions involving only three mathematical operations including a bracket.

<ul style="list-style-type: none"> • Introducing inverse proportions • Problems related to inverse proportions • Work and time 	<ul style="list-style-type: none"> • Identifies the inverse proportion by analyzing relationship between two quantities. • Solves simple problems related to work and time using the knowledge on inverse proportions. 	
<ul style="list-style-type: none"> • Types of taxes (Duty, income tax, rates, VAT) • Introduction • Calculations 	<ul style="list-style-type: none"> • Identifies the taxes - rates, duty, income tax and Value Added Tax(VAT) • Engages in calculations related to rates. • Engages in calculations related to duty. • Engages in calculations related to income tax. • Engages in calculations related to VAT. • Solves problems related to taxes. 	<ul style="list-style-type: none"> • Only calculations such that tax percentage is a whole number and the answer is a numerical value. (problems including algebraic terms or expressions are not expected)
<ul style="list-style-type: none"> • Simple interest • Interest Rate <ul style="list-style-type: none"> • Annual/monthly • Calculating the interest 	<ul style="list-style-type: none"> • Identifies simple interest as the interest calculated by considering the initial amount, the time and the interest rate. • Recognizes that the interest received during equal time periods with same interest rate is same for a given amount of money. • Calculates the interest for a given amount, for a given period and given interest rate. • Solves problems of finding the interest or the interest rate or the 	<ul style="list-style-type: none"> • Only calculations such that tax percentage is a whole number and the answer is a numerical value (problems including algebraic terms or expressions are not expected)

	time or the amount, when the necessary information are given.	
<ul style="list-style-type: none"> Relationship between indices and logarithms Logarithm \leftrightarrow Power conversion 	<ul style="list-style-type: none"> Describes the logarithm of a number in terms of the base, when the number is expressed in index form. Converts an expression in index form to logarithmic form and an expression in logarithm form to index form. 	
<ul style="list-style-type: none"> Geometric progressions <ul style="list-style-type: none"> Introduction n^{th} term 	<ul style="list-style-type: none"> Identifies number sequences of which the quotient between a term and the preceding term is a constant, as geometric progressions. Finds the common ratio (r) of a geometric progression such that the values of a and r are integers. Finds the n^{th} term (T_n) of a geometric progression such that the values of a and r are integers. 	<ul style="list-style-type: none"> Expressing the final answer in the form of indices is necessary.
<ul style="list-style-type: none"> Compound Interest <ul style="list-style-type: none"> Calculations of compound interest (Up to two terms) 	<ul style="list-style-type: none"> Identifies the method of compound interest. Performs calculations related to compound interest 	<ul style="list-style-type: none"> Only up to two terms with the percentage of interest is a whole number. (problems including algebraic terms or expressions are not expected)
<ul style="list-style-type: none"> Limited Companies <ul style="list-style-type: none"> Shares 	<ul style="list-style-type: none"> Accepts that many people can be involved in a business through the investment in shares. Accepts that limited companies supply their capital by issuing shares. 	

	<ul style="list-style-type: none"> Names the price of a share of an established company as the Market Price of a share. States that the value of shares (invested funds) is obtained by multiplying the market price of a share by the number of shares. States that the number of shares that can be bought is obtained by dividing the invested funds (Value of shares) by the market price of a share. Calculates the dividend income that an investor receives by multiplying the dividend paid for a share by the number of shares. Solves problems involving invested funds (Value of shares), market price of a share, capital profit and dividend paid for a share. 	
<ul style="list-style-type: none"> Perimeter Sectors 	<ul style="list-style-type: none"> Calculates the perimeter of sectors. Solves problems involving compound plane figures including sectors. 	<ul style="list-style-type: none"> Perimeter of sectors with angle at the centre is 45°, 90° and 180° and the radius of the circle is a whole number of multiple of 7 only. Perimeter of compound plane figures including only one sector and maximum of two plane figures out of square, rectangle, right angled triangle, trapezium with whole number measurements only. Finding the radius when arc length and perimeter are given and finding the arc length when radius and perimeter are given only.

<ul style="list-style-type: none"> • Area • Sectors 	<ul style="list-style-type: none"> • Finds the area of sectors. • Solves problems related to area of compound plane figures including sectors. 	<ul style="list-style-type: none"> • Area of sectors with angle at the centre is 45°, 90° and 180° and the radius is a multiple of 7 only. • Area of compound plane figures including only one sector and maximum of two plane figures out of square, rectangle, right angled triangle, trapezium with whole number measurements only. (Finding the radius or the angle at the sector when area of the sector is given is not expected)
<ul style="list-style-type: none"> • Surface Area • Cylinder(Solid) 	<ul style="list-style-type: none"> • Finds the surface area of a right circular cylinder using the formula $A = 2\pi r^2 + 2\pi rh$, where radius, r is a whole number of multiple of 7 and height h is also a whole number • Finds the value of h of a right circular cylinder when the surface area A is given 	<ul style="list-style-type: none"> • Right circular solid cylinders of which r is a multiple of 7 and height h is a whole number only. • Only the right circular solid cylinders of which A is a whole number, r is a multiple of 7 and h is a whole number value.
<ul style="list-style-type: none"> • Surface Area • A right prism with a triangular cross-section 	<ul style="list-style-type: none"> • Identifies the shapes of faces of a right prism with a triangular cross-section. 	<ul style="list-style-type: none"> • Finding the surface area is not expected.

<ul style="list-style-type: none"> • Volume • Cylinder 	<ul style="list-style-type: none"> • Finds the volume of a right circular cylinder using the formula $V=\pi r^2 h$. • Finds the value of height h of a right circular cylinder when the volume V is given. • Finds the value of radius r of a right circular cylinder when volume V is given. 	<ul style="list-style-type: none"> • Only the right circular cylinders of which r is a multiple of 7 and h is a whole number. • Right circular cylinders of which r is a multiple of 7 and V is a whole number only. • Only the right circular cylinders of which h and V are whole numbers. (r should be a perfect square)
<ul style="list-style-type: none"> • Volume • A right prism with a triangular cross-section 	<ul style="list-style-type: none"> • Calculates the volume of a right prism with a triangular cross-section. 	<ul style="list-style-type: none"> • Right prisms with the area of cross-section is given only (Finding the cross section or the height of the prism when volume is given is not expected)
<ul style="list-style-type: none"> • Distance and time • Representation by a distance time graph (when the speed is uniform) • Gradient of the graph = $\frac{\text{distance}}{\text{time}} =$ 	<ul style="list-style-type: none"> • Recognizes the speed as the rate of change of distance with respect to time. • Writes the relationship between distance, time and speed. • Represents the information on distance and time by a graph. • Recognizes that the speed is obtained by the gradient of a distance-time graph. • Solves problems related to distance, time and speed. • Solves simple problems related to volume and time. 	<ul style="list-style-type: none"> • Problems excluding unit conversions and final answer is a whole number only. • The instances when giving two quantities of $\text{speed} = \frac{\text{distance}}{\text{time}}$ only. • Two instances when giving two quantities of $\text{rate} = \frac{\text{volume}}{\text{time}}$ including liquids flowing through pipes.

<p>speed</p> <ul style="list-style-type: none"> • Volume and time 		
<ul style="list-style-type: none"> • Angle of elevation and the angle of depression. 	<ul style="list-style-type: none"> • Identifies the angle of elevation. • Identifies the angle of depression. • Describes the location of an object in terms of the angle of depression and the angle of elevation. 	<ul style="list-style-type: none"> • Problems of finding the location using a given diagram are included. (Drawing scale diagrams is not expected)
<ul style="list-style-type: none"> • Trigonometric ratios <ul style="list-style-type: none"> • Sine • Cosine • Tangent 	<ul style="list-style-type: none"> • Discovers that the sine value of an angle in a right angled triangle is given by the ratio of the length of the opposite side to the length of the hypotenuse. • Discovers that the cosine value of an angle in a right angled triangle is given by the ratio of the length of the adjacent side to the length of the hypotenuse. • Discovers that the tangent value of an angle in a right angled triangle is given by the ratio of the length of the opposite side to the length of the adjacent side. 	<ul style="list-style-type: none"> • Including the problems related to finding the trigonometric ratios, when lengths of any two sides of a right angled triangle are given. • Including the problems related to finding the length of an unknown side, when the trigonometric ratio and the length of one of the sides of corresponding ratio are given.
<ul style="list-style-type: none"> • Finding factors <ul style="list-style-type: none"> • Of the form $ax^2 + bx + c$ 	<ul style="list-style-type: none"> • Finds the factors of expressions of the form $ax^2 + bx + c$. 	<ul style="list-style-type: none"> • Such that $0 < a \leq 5$, $b^2 - 4ac$ is a perfect square and a, b, c □ □
<ul style="list-style-type: none"> • Least common multiple of algebraic expressions 	<ul style="list-style-type: none"> • Recognizes that the smallest algebraic term that can be divided by several algebraic terms is the least common multiple of these terms. • Finds the least common multiple of given algebraic terms. 	<ul style="list-style-type: none"> • Only the instances where two unknowns with not more than three terms such as $x^2, 2xy, 3y$ of indices not more than two.
<ul style="list-style-type: none"> • Algebraic fractions 	<ul style="list-style-type: none"> • Explains the necessity of equivalent fractions for the addition and 	

<ul style="list-style-type: none"> • Addition • Subtraction 	<p>subtraction of algebraic fractions.</p> <ul style="list-style-type: none"> • Adds and simplifies algebraic fractions with algebraic terms and related denominators. • Subtracts and simplifies algebraic fractions with algebraic terms and related denominators. • Simplifies algebraic fractions with algebraic terms and related denominators. 	<ul style="list-style-type: none"> • Instances are not more than three algebraic fractions with equal denominators and the index is not more than two and the denominators with same unknowns only. • (Algebraic expressions in the denominators are not expected)
<ul style="list-style-type: none"> • Linear equations with algebraic fractions <ul style="list-style-type: none"> • Solving 	<ul style="list-style-type: none"> • Recognizes that the methods of simplifying algebraic fractions can be used to solve simple equations involving algebraic fractions. • Solves simple equations involving algebraic fractions including algebraic terms in the denominator. 	<ul style="list-style-type: none"> • Instances upto two algebraic fractions with same unknown in the denominator and unequal denominators are included. (Algebraic expressions in the denominators are not expected)
<ul style="list-style-type: none"> • Simultaneous equations <ul style="list-style-type: none"> • Solving • Solving quadratic equations <ul style="list-style-type: none"> • Using factors 	<ul style="list-style-type: none"> • Solves pairs of simultaneous equations with distinct coefficients. • Factorizes the corresponding algebraic expression of an algebraic equation. • Recognizes that for a product of two expressions to be zero, at least one of the expressions should be zero. • Solves quadratic equations using factors. 	<ul style="list-style-type: none"> • Problems with 2 variables of unequal whole number coefficients and whole number solutions only. • Instances where $ax^2 + bx + c = 0$; $0 < a \leq 5$ $b^2 - 4ac$ is a perfect square only
<ul style="list-style-type: none"> • Calculating the gradient and the intercept of a straight line of the form $y = mx + c$ (Using 	<ul style="list-style-type: none"> • Calculates the gradient of an equation of the form $y = mx + c$ when coordinates of two points on the straight line are given. • Calculates the gradient of an equation of the form $y = mx + c$ when the graph of the equation is given. • Determines the relationship between the two variables using the 	<ul style="list-style-type: none"> • Only the instances when given the whole number coordinates of two points lie in first quadrant or on its axes • The line segment in the first

coordinates)	gradient and the intercept of the straight line.	quadrant must be drawn. (passing through the origin is also included)
<ul style="list-style-type: none"> Algebraic fractions <ul style="list-style-type: none"> Multiplication Division 	<ul style="list-style-type: none"> Multiplies algebraic fractions including algebraic terms Finds the reciprocal of an algebraic fraction. Divides algebraic fractions including algebraic terms. 	<ul style="list-style-type: none"> With two unknowns in the numerator or in the denominator or in both the numerator and the denominator only.
<ul style="list-style-type: none"> Inequalities Solving and representing solutions on a number line Of the form $ax + b \leq c$ Of the form $ax + b > cx + d$ ($a, b, c, d \in \mathbb{Z}$) 	<ul style="list-style-type: none"> Finds the integral solution set of the inequalities $ax + b < c$; $ax + b > c$; $ax + b \leq c$; $ax + b \geq c$; $ax + b > cx + d$; $ax + b < cx + d$; $ax + b \leq cx + d$ and $ax + b \geq cx + d$. Represents the integral solutions sets of the inequalities $ax + b < c$; $ax + b > c$; $ax + b \leq c$; $ax + b \geq c$; $ax + b > cx + d$, $ax + b < cx + d$, $ax + b \leq cx + d$ and $ax + b \geq cx + d$ on a number line. Finds the intervals of solutions of the inequalities $ax + b < c$; $ax + b > c$; $ax + b \leq c$; $ax + b \geq c$; $ax + b > cx + d$, $ax + b < cx + d$, $ax + b \leq cx + d$ and $ax + b \geq cx + d$. Represents the intervals of solutions of the inequalities $ax + b < c$; $ax + b > c$; $ax + b \leq c$; $ax + b \geq c$; $ax + b > cx + d$, $ax + b < cx + d$, $ax + b \leq cx + d$ and $ax + b \geq cx + d$ on a number line. 	<ul style="list-style-type: none"> Only the instances where $a, b, c \in \mathbb{Z}$ and $a > 0$.
<ul style="list-style-type: none"> Matrices <ul style="list-style-type: none"> Introduction (Up to 3×3) Adding and 	<ul style="list-style-type: none"> Identifies a matrix as a method of presenting information in rows and columns. Recognizes that the order of a matrix is given by the number of rows and the number of columns of the matrix. 	<ul style="list-style-type: none"> Only integral elements in multiplication of matrices

<p>subtracting (Up to 3×3)</p> <ul style="list-style-type: none"> • Multiplying a matrix by a scalar (Up to 3×3) • Multiplying two matrices (Up to 2×2) 	<ul style="list-style-type: none"> • Recognizes row matrices, column matrices, square matrices, unit matrices and symmetric matrices. • Understands through practical situations that to add or subtract matrices, their orders should be equal. • Adds and subtracts two row matrices. • Adds and subtracts two column matrices. • Adds and subtracts matrices of the same order up to matrices of order 3×3. • Multiplies a matrix of order up to 3×3 by an integer. • Simplifies expressions including matrices under the operations of addition, subtraction and multiplication by an integer. • Understands that to multiply two matrices, the number of columns of the first matrix should be equal to the number of rows of the second matrix. • Multiplies two matrices of order up to 2×2. 	
<ul style="list-style-type: none"> • Calculations related to the theorem “The sum of the three interior angles of a triangle is 180°” • Calculations related to the theorem “If a side of a triangle is produced, the exterior angle so 	<ul style="list-style-type: none"> • Performs calculations using the theorem, “The sum of the three interior angles of a triangle is 180°”. • Performs calculations using the theorem, “If a side of a triangle is produced, the exterior angle so formed is equal to the sum of the two interior opposite angles”. 	<ul style="list-style-type: none"> • Geometrical concepts learnt in lower grades and the subject content learnt in grade 10 or 11 can be used in calculations. (Proving postulates is not expected)

<p>formed is equal to the sum of the two interior opposite angles” .</p>		
<ul style="list-style-type: none"> • Congruency <ul style="list-style-type: none"> • Identifying the conditions under which two triangles are congruent <ul style="list-style-type: none"> • S.A.S. • A.A.S • S.S.S • Hyp. S 	<ul style="list-style-type: none"> • Identifies two plane figures which coincide with each other as congruent figures. • Identifies the properties of congruent plane figures. • Identifies the conditions that are necessary and sufficient for two triangles to be congruent as S.A.S., A.A.S., S.S.S. and Hyp.S. 	
<ul style="list-style-type: none"> • Isosceles Triangles <ul style="list-style-type: none"> • Calculations related to the theorem “If two sides of a triangle are equal, the angles opposite to those sides are equal” • Calculations related to the converse of the theorem “If two sides of a triangle are equal, the angles 	<ul style="list-style-type: none"> • Identifies the theorem, “If two sides of a triangle are equal, the angles opposite to those sides are equal”. • Performs calculations using the theorem, “If two sides of a triangle are equal, the angles opposite to those sides are equal”. • Performs calculations using the converse of the theorem, “If two sides of a triangle are equal, the angles opposite to those sides are equal”. 	

<p>opposite to those sides are equal”</p>		
<ul style="list-style-type: none"> • Properties • Calculations related to the theorem “In a parallelogram, opposite sides are equal; opposite angles are equal; and each diagonal bisects the area of the parallelogram” 	<ul style="list-style-type: none"> • Identifies the theorem, “In a parallelogram, opposite sides are equal; opposite angles are equal; and each diagonal bisects the area of the parallelogram”. • Performs simple calculations using the theorem, “In a parallelogram, opposite sides are equal; opposite angles are equal; and each diagonal bisects the area of the parallelogram”.
